

ASSIGNMENT - GIT

Assignment 1: Initialize a new Git repository in a directory of your choice. Add a simple text file to the repository and make the first commit.

Solution :

Here, I start a new Git repository in my directory called Training and add a file called Demo.txt with the text "Git demo" in it:

Open a terminal and navigate to the directory where you want to create the Training directory.

Step-1. Create the Training directory using the mkdir command:

```
mkdir WiproTraining
```

Step-2. Navigate to the Training directory using the cd command:

```
cd Training
```

Step-3. Initialize a new Git repository using the git init command:

```
git init
```

Step-4. Create a new file named Demo.txt using a text editor of your choice (e.g. vim etc.) and add the text "Git demo" to it.

Add the Demo.txt file to the Git repository using the git add command:

```
git add Demo.txt
```

Step-5. Commit the changes to the Git repository using the git commit command:

```
git commit -m "Initial commit with Demo.txt"
```

Step-6. You can verify that everything worked correctly by checking the status of the repository:

```
git status
```

This command will show you the current status of the repository.

: After running these commands, you should have a new Git repository in the Training directory with a single commit that includes the Demo.txt file with the text "Git demo" in it.

Assignment 2: Branch Creation and Switching

Create a new branch named 'feature' and switch to it. Make changes in the 'feature' branch and commit them.

Solution :

I have created a new branch named **'feature'**, switched to it, made the changes, and committed them:

Step-1. This will create a new branch called 'feature' and switch to it. Now you can make changes in this branch.

ASSIGNMENT - GIT

```
git checkout -b feature
```

Step-2. you want to modify the Demo.txt file in the 'feature' branch, you can use a text editor to modify the file and then stage and commit the changes using the following commands:

```
git add Demo.txt
```

```
git commit -m "Updated Demo.txt in feature branch"
```

: This will stage the changes in Demo.txt and commit them to the 'feature' branch.

Step-3. To switch back to the 'master' branch, you can use the following command:

```
git checkout master
```

: This will switch your working directory to the 'master' branch.

Assignment 3: Feature Branches and Hotfixes

Create a 'hotfix' branch to fix an issue in the main code. Merge the 'hotfix' branch into 'main' ensuring that the issue is resolve.

Solution:

I have created a 'hotfix' branch to fix an issue in the main code and merge it into 'main', you can follow these steps:

Step-1. First, switch to the 'main' branch:

```
git checkout main
```

Step-2. Create a new 'hotfix' branch:

```
git checkout -b hotfix
```

Step-3&4. Make the necessary changes to fix the issue in the 'hotfix' branch. For example, you can modify the Demo.txt file to fix a typo.

Stage and commit the changes in the 'hotfix' branch:

```
git add Demo.txt
```

```
git commit -m "Fixed typo in Demo.txt"
```

Step-5. Switch back to the 'main' branch:

```
git checkout main
```

Step-6. Merge the 'hotfix' branch into 'main':

```
git merge hotfix
```

This command merges the changes from the 'hotfix' branch into the 'main' branch. If there are no conflicts, Git will automatically merge the branches. If there are conflicts, you'll need to resolve them manually.

Step-7. Verify the fix:

ASSIGNMENT - GIT

Once the merge is successful, verify that the issue is resolved by testing your code.

I 've successfully created a 'hotfix' branch to fix an issue in the main code and merged it into 'main' to ensure that the issue is resolved.
